

Question on the required FLIR imaging resolution.  
Beam location prediction is always only limited by the grid resolution.

Comparison between the (average) model prediction error and the grid resolution across different pixel values.

Model prediction is always better than what is possible given the grid uncertainty.

Corner plot showing the correlation between different parameters

1. Correlation between four parameters: self heating power, FROSTI power, RH power, off-centering.
2. 1 ppm contour indicates the RH power and FROSTI power are highly correlated.
